## Rheinmetall LLM-VarioRay – the laser light module family for modern armed forces

Intended primarily for small arms carried by infantry and other dismounted operating combat forces, laser light modules are used for detecting, identifying and marking targets. With its LLM-VarioRay product family, Rheinmetall offers a powerful portfolio in this field. Designed and produced by Rheinmetall Soldier Electronics, the LLM-VarioRay has established itself with many armed forces. Among other things, the LLM-VarioRay product family has long form part of the German soldier system “Future Soldier – Expanded System” (IdZ-ES). It is also in service with the British Army, which calls it the Laser Light Module MK3, and with the Swiss Army, where it is known as the Laser-Licht-Modul 19. Furthermore, in summer 2021 the Bundeswehr has selected Rheinmetall to supply laser light modules for the German armed forces. A corresponding framework contract envisages delivery of up to 130,000 laser light modules.

Because the devices can be mounted via a standard interface onto all assault rifles, submachine guns, machine guns and sniper rifles currently in the Bundeswehr inventory, they can greatly improve the ability of German troops to fight at night.

Weighing around 250 grams including the bracket, the LLM-VarioRay can be mounted on any assault rifle with a MIL-STD 1913 rail/STANAG 4694 and operated via a trigger cable. It features a powerful white lamp, a red-light laser marker, an infrared laser marker and an electrically focusable infrared illuminator. The light source can be selected with a rotary switch and is infinitely adjustable. The device has a fully integrated, factory-aligned laser block, enabling easy adjustment and alignment of the aiming device and weapon. Together with night observation and thermal imaging devices, it lets troops perform a full range of operational missions around the clock and in all weathers.

Rheinmetall offers an extensive portfolio of infantry equipment, including a variety of aiming and illumination modules. These were developed in order to enhance the tactical effectiveness of modern small arms. One of these products is the LM-VTAL. Standing for “Laser Module - Variable Tactical Aiming Laser”, it is used by Bundeswehr special operators. Rheinmetall’s aiming and illumination devices are compatible with all standard night observation devices and can be coupled with the “TL-MissionLight”, a separate modular weapon lamp also made by Rheinmetall. Another top-of-the-line Rheinmetall product is the “FCS-TacRay Ballistic”, a rangefinder/ballistic computer for snipers and machine gunners.

### ► Key facts

- Advanced, high-performance device enhances the ability of troops to fight at night
- Includes white-light lamp, red-light laser marker, infrared laser marker and infrared illuminator
- Can be used with existing small arms
- In use with several armed forces
- Selected for the German Armed Forces’ new assault rifle
